SQL Stored Procedures and Application Modernization

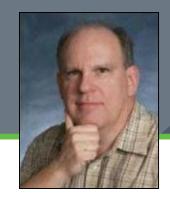

John Valance

Division 1 Systems johnv@div1sys.com

www.div1sys.com

About John Valance

- Independent Consultant for past 15 years
- Founder and CTO of Division 1 Systems (www.div1sys.com)
 - Specialty is helping IBM shops develop web apps and related skills
 - Training, mentoring, project management, consultation and coding
- 30+ years IBM midrange experience (S/38 thru IBM i)
- 15+ years of web development experience
 - Web scripting language of choice = PHP
- Frequent presenter on web development topics
- Erstwhile Trainer for Zend Technologies
 - Taught Intro to PHP for RPG programmers
- Zend Certified Engineer

Stored Procedures: What, Why, Who?

What We Will Cover

- Introduction
 - Who, What, Why
 - Application Modernization
- Creating Stored Procedures
- SQL Procedure Language
 - Language Syntax and Capabilities
- Creating UDFs
- IBM i Considerations
- Examples from the trenches (time permitting)

What Are Stored Procedures?

- Any program object on IBM i
 - Known to DB2 via CREATE PROCEDURE statement
- 2 types:
 - SQL (written in SQL/PL)
 - External (RPG, CL, any language)
 - We will focus on SQL stored procedures
- Can be called from any environment that supports SQL
- Can have parameters for input / output
- Can return result sets
- Can be selected from the database repository
 - SELECT * FROM QSYS2/SYSPROCS WHERE ROUTINE_SCHEMA = 'MYLIBR'

What is SQL/PL?

- SQL Procedure Language
- Allows SQL scripts to be built
 - Any SQL statements, plus variables, conditions, loops, etc.
 - Data-centric programming
- DB2 SQL/PL is proprietary
 - but all major DB vendors have proprietary PL
- Compiled using an SQL client (ACS recommended)
- Generates an ILE/C language program, with embedded SQL calls

Simple example - sp_Cust

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
    -- declare the cursor for the select statement
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                ZIP,
                CUST id,
                COMPANY,
                trim(LASTNAME) | ', ' | trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
   open c1;
end;
```

Running sp_Cust from ACS

- ACS = Access Client Solutions
 - Formerly known as Client Access
 - Has an SQL client which is perfect for developing stored procedures on IBM i

```
755 -- Testing:
756 call jvalance.sp_cust();
757
```

STATE	ZIP	CUST_ID	COMPANY	NAME
AL	30696	3042	Gold Coast Supply	Falls, Elaine
AL	32145	2984	Professional Divers, Ltd.	Mathers, Shirley
AL	32145	3041	Divers of Blue-green	Bean, Nancy
CA	90410	3984	Blue Glass Happiness	Taylor, Christine
CA	90740	3054	Catamaran Dive Club	Dupont, Nicole
CA	91770	3053	American SCUBA Supply	Cinciripini, Lynn
CA	92195	3052	Underwater Sports Co.	Walling, Dave
CA	95443	3051	San Pablo Dive Center	O'Brien, Patricia
FL	30643	6312	Aquatic Drama	Owen, Gillian
FI.	32274	1645	Action club	furling. Michael

What Can I Build with SQL/PL?

- Stored procedures
- User Defined Functions (UDF)
- Triggers before & after (add/change/delete)

Redbooks / References

New Redbook - April 2016!!

- SQL Procedures, Triggers, and Functions on IBM DB2 for i
 - http://www.redbooks.ibm.com/abstracts/sg248326.html
 - Download the PDF!!
- Also:
 - ▶ DB2 for i SQL reference https://www.ibm.com/support/knowledgecenter/ssw_ibm_i_72/db2/rbafzprintthis.htm
 - SQL Programming Guide:
 https://www.ibm.com/support/knowledgecenter/ssw_ibm_i_73/sqlp/rbafykickoff.htm

Benefits of SQL Stored Procedures

- Declarative, standardized programming language
 - Puts SQL in the driver's seat
- Centralize business logic
 - Data-Centric programming
 - Business logic close to the DBMS
- Simplicity of application code
 - No embedded SQL
 - No ORM issues
- Impact of change insulation
 - No level checks
 - Loose coupling between DB and apps

- Leverage SQL enhancements
 - Features and performance
- Security
 - No SQL injection
 - Define authority on stored procedures vs. tables/views
- Performance
 - Execution plan / Precompiled
- Modernize DB interface
 - Similar to a View
 - Renamed fields, Derived fields
 - Provide simple interface to complex legacy DB structure

Whom Is This For?

IT Managers / Directors

Don't replace - Refactor!

RPG Programmers

- Modernize your database skills
- You probably know SQL already

Database Administrators

 Play an active role in application modernization

Project Managers

- Focus on database issues
- Delegate programming

Web Application Developers

- Browser applications
- Ajax developers
- API / Web Service Developers

Users of Analysis & Reporting Tools

- Excel spreadsheets / VBA apps
- Crystal Reports and other reporting tools

Application Modernization

What is the Goal of Modernization?

- Interoperability between systems
 - Client / Server
- Responsiveness to changing business requirements
 - Centralization of business rules
 - Changing landscape of devices and interfaces
- Speed of Development
 - Rapid prototyping and testing of business logic with SQL
- Ease of Maintenance
 - Use of standardized languages

Building Procedures with SQL/PL

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
    -- declare the cursor for the select statement
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                ZIP,
                CUST_id,
                COMPANY,
                trim(LASTNAME) | ' ' | trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
    open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
    -- declare the cursor for the select statement
                                                          Create procedure
    declare c1 cursor with return for
                                                              statement
        select trim(STATE) as STATE,
                ZIP,
                CUST_id,
                COMPANY,
                trim(LASTNAME) || ', ' || trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
    open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
                                               Options
    -- declare the cursor for the selection
                                           (many available)
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                ZIP,
                CUST_id,
                COMPANY,
                trim(LASTNAME) | ' ' | trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
    open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
                                                         Procedure Body
begin
    -- declare the cursor for the select stateme
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                ZIP,
                CUST id,
                COMPANY,
                trim(LASTNAME) || ', ' || trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
   open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
    -- declare the cursor for the select statement
   declare d1 cursor with return for
        seledt trim(STATE) as STATE,
                ZIP,
                CUST id,
                COMP
                        Body is a compound SQL
                                                   STNAME) AS NAME
                trim
                         statement enclosed in
        from Zendsvr
                           begin/end block
        where COUNTR
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
   open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
                                                             Declarations
language sql
result sets 1
begin
       declare the cursor for the select statement
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                ZIP,
                CUST id,
                COMPANY,
                trim(LASTNAME) || ', ' || trim(FIRSTNAME) AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
    open c1;
end;
```

```
create or replace procedure jvalance.sp cust ( )
language sql
result sets 1
begin
    -- declare the cursor for the select statement
    declare c1 cursor with return for
        select trim(STATE) as STATE,
                                                         Executable
                ZIP,
                                                         statements
                CUST_id,
                COMPANY,
                trim(LASTNAME) || ', ' || trim(FIRS
                                                       AS NAME
        from zendsvr6.sp cust
        where COUNTRY = 'US'
        order by STATE, ZIP;
    -- open the cursor to return results to the caller
    open c1;
end;
```

SQL = Declarative Programming

- Procedural programming
 - Specify how to get the data
- Declarative programming
 - Specify what you want from the database
 - Database will figure out the most efficient way to execute
- Always select from PF / Table, not LF or View
- Database will create an access plan stored with object
- Create indices (LFs) to improve performance
- SQL Performance Center in ACS
 - Help with DB tuning based on runtime analysis

Compiling and Running

Need to use an SQL Client to run the CREATE PROCEDURE

- SQL client choices
 - ACS = Access Client Solutions (** best choice **)

Green screen STRSQL (awkward)

- \$\$
- Eclipse Data Tools plug-in for RDi, Zend Studio, etc. (pretty good)
- Other SQL Clients JDBC, ODBC (ex.: http://www.sql-workbench.net/)
- Biggest issue is handling output parameters
 - ACS or Client Access handles this well
 - ACS / CA also gives best diagnostic messages
- ACS is FREE!!
 - https://www-03.ibm.com/systems/power/software/i/access/solutions.html

Where To Put Source Code?

Store your source code in an .sql file

- On your PC
 - With ACS installed, double click to open and run
- On IBM i IFS
 - Use an IDE like Eclipse, RDi, Zend Studio
 - Includes SQL syntax highlighting
 - May need to install Data Tools (help menu... Install New Software)
 - Can open IFS file in ACS
 - Right click... Open With... System Editor
- SRCPF ? (maybe, but not for me)
 - SEU? (really??)
 - RUNSQLSTM or STRSQL (hmmm...)

Customer Listing

Running from Excel

Use MS Query, and edit SQL directly: call sp_cust()

Adding Parameters

- Add 2 input parameters: State and Country filters
 - Add to parameter list
 - Add to WHERE clause to serve as result filters

```
create or replace procedure jvalance.sp cust parm (
   IN in State char(2),
    IN in_Country varchar(20)
language sql
result sets 1
begin
    declare c1 cursor with return for
   select * from zendsvr6.sn cust
   where STATE = in State
    and COUNTRY = in Country;
   open c1;
end
```

- Separate multiple parameters with commas
- Can all go on one line, but easier to read on separate lines

Types of Parameters

- IN = Input
- OUT = Output
- INOUT = Input and Output

```
create procedure sp_SaveOrderHeader (
    IN in_CustNum dec(8,0),
    IN in_ShipTo dec(4,0),
    INOUT io_OrderNum dec(12,0),
    OUT out_message varchar(150)
)
```

Run / Test SP with Parameters

call jvalance.sp_cust_parm('HI', 'US');

call jvalance.sp_cust_parm('', 'Canada');

call jvalance.sp cust parm('OR', '');

```
create or replace procedure jvalance.sp cust parm (
   IN in State char(2),
   IN in Country varchar(20)
language sql
result sets 1
begin
   declare c1 cursor with return for
                                                  May yield
    select * from zendsvr6.sp cust
                                            unexpected results!!
   where STATE = in State
    and COUNTRY = in Country;
   open c1;
end
```

return 0 rows

These both

Ignoring Blank Filter Parameters

```
create or replace procedure jvalance.sp_cust_parm (
    IN in State char(2),
    IN in Country varchar(20)
language sql
result sets 1
begin
    declare c1 cursor with return for
    select cu.*,
    from zendsvr6.sp cust cu
    where (trim(in_State) = '' or trim(STATE) = trim(in_State))
            (trim(in Country) = '' or trim(COUNTRY) = trim(in Country))
    and
    open c1;
end
```

Ignoring Blank Filter Parameters

```

Beware Procedure Signatures!!

- Procedure Overloading
 - ▶ Two or more procedures with same name, but different signatures
- Procedure Signature
 - Name + Number of Parameters (data type irrelevant)
 - Ex.: these have different signatures
 - MyProc(char(5), int)
 - MyProc(int)
 - these have same signature:
 - MyProc(char(5))
 - MyProc(int)
- Can cause a lot of confusion
- DROP PROCEDURE explicitly using Navigator... Databases
 - Drill down to procedures

SQL/PL Basics

Declaring/Using Variables

Create variables to hold trimmed() input values

```
begin
    declare wk state char(2);
    declare wk country varchar(20);
    declare c1 cursor with return for
    select
    from
            zendsvr6.sp cust
            (wk state = '' or
                                trim(STATE) = wk state)
    where
                             or trim(COUNTRY) = wk_country));
            (wk country = ''
    and
    set wk state = trim(in State);
    set wk_country = trim(in_Country);
    open c1;
end
```

Declaring/Using Variables

Create variables to hold trimmed() input values

```
begin
                                                   Declare variables
   declare wk state char(2);
                                                    before cursors
   declare wk country varchar(20);
   declare c1 cursor with return for
   select
   from
           zendsvr6.sp cust
   where (wk_state = '' or trim(STATE) = wk_state)
            (wk country = '' or trim(COUNTRY) = wk country));
   and
   set wk state = trim(in State);
   set wk country = trim(in Country);
   open c1;
end
```

Declaring/Using Variables

Create variables to hold trimmed() input values

```
Declaration
begin
                                                             statements
   declare wk state char(2);
   declare wk country varchar(20);
   declare c1 cursor with return for
   select
   from
           zendsvr6.sp cust
   where (wk_state = '' or trim(STATE) = wk_state)
            (wk country = '' or trim(COUNTRY) = wk country));
   and
   set wk_state = trim(in_State);
   set wk_country = trim(in_Country);
                                                         Executable
   open c1;
                                                         statements
end
```

sp_Get_Cust_Name More Features of SQL/PL

```
create or replace procedure jvalance.sp Get Cust Name(
    IN in cust id dec(8,0),
    OUT out cust name varchar(42),
                                                      Output Parameters
   OUT out message varchar(100)
language sal
                                    No Result Sets
result sets 0
begin
    declare wk first char(20);
    declare wk last char(20);
                                                SELECT INTO
    select FIRSTNAME, LASTNAME
    into wk first, wk last
    from sp cust where cust id = in cust id;
                                                                   Conditional Logic
    -- Check for null values - which means record not found
                                                                   (IF /THEN/ ELSE)
    if wk first is null then
        set out message = 'Customer ID ' || in cust id || ' is not valid.';
        return;
    else
        set out cust name = trim(wk first) || ' ' || trim(wk last);
        return:
   end if;
end:
```

User Defined Functions (UDFs)

User Defined Functions

Two types:

- User Defined Scalar Functions
- User Defined Table Functions
- We will focus on scalar functions
 - Like BIFs or SQL scalar functions
 - SUBSTRING('hello world', 7) => returns 'world'
 - STRIP(' blank on both ends ') => returns 'blank on both ends'
 - UPPER('hello') => returns 'HELLO'
 - Can be used in
 - Expressions
 - Select lists as computed columns

Ex: select substring(COMPANY, 1, 5) as COMP_SHORT from SP_CUST

fn_Get_Cust_Name(in_cust_id)

```
create or replace function
jvalance.fn Get Cust Name(
    in cust id dec(8,0)
returns varchar(42)
language sql
begin
    declare wk first char(20);
    declare wk last char(20);
    declare wk custname varchar(42) default '';
    select FIRSTNAME, LASTNAME
    into wk first, wk last
    from sp cust where cust id = in cust id;
    -- Check for null values - which means record not found
    if wk first is not null then
        set wk_custname = trim(wk_first) || ' ' || trim(wk_last);
    end if;
    return wk custname;
end:
```

fn_Get_Cust_Name(in_cust_id)

```
CREATE FUNCTION
create or replace function
jvalance.fn Get Cust Name(
                                    Input parameters only!
    in cust id dec(8,0)
                                       (Don't specify IN)
                                                                  Declare a
returns varchar(42)
                                                               variable to hold
language sql
                                    Declare returned
                                                                  the return
begin
                                        data type
    declare wk first char(20);
                                                                    value
    declare wk last char(20);
    declare wk_custname varchar(42) default '';
    select FIRSTNAME, LASTNAME
    into wk first, wk last
    from sp cust where cust id = in cust id;
                                                         Set the return
                                                         variable value
    -- Check for null values - which means regard
    if wk first is not null then
                                                    trim(wk last);
        set wk custname = trim(wk first)
    end if;
                                                  Use return
    return wk custname;
                                             statement to return
end:
                                                                            < div1 >
                                                  the value
```

Testing fn_Get_Cust_Name(in_cust_id)

- You can test your UDFs using the SYSDUMMY1 table
 - ▶ IBM-supplied, single record table, for testing function calls
 - In library SYSIBM

```
select 1384 as cust_id, fn_Get_Cust_Name(1384) as cust_name
from sysibm.sysdummy1
```

```
878 select 1384 as cust_id, fn_Get_Cust_Name(1384) as cust_name
879 from sysibm.sysdummy1;
880

CUST_ID CUST_NAME
1384 Russell Christopher
```

Another Example - fn_CurrDate8()

Format current date as dec(8,0) in YYYYMMDD format

```
create or replace function jvalance.fn_CurrDate8()
returns dec(8,0)
language SQL
set option datfmt = *ISO

BEGIN
    return dec(replace(char(current date, ISO),'-',''),8,0);
END;
```

```
881 select fn_CurrDate8() as date8
882 from sysibm.sysdummy1

DATE8
20170408
```

```
insert into prodlib.ORDHDR (
    OHORD, OHENTDAT
) values (
    in_OrderNo, fn_CurrDate8()
)
```

Looping

The LOOP loop

- Loop infinitely
- Requires a conditional LEAVE or RETURN statement to exit the loop
- Like RPG DO

```
LOOP

call work_to_do( all_done );

IF all_done = 1 THEN

LEAVE;

END IF;

END LOOP;
```

The WHILE loop

- Loop until condition is false
- Condition tested at beginning of loop
 - Like RPG DOW
 - Set condition before loop, or it may never enter loop body
- Can also use LEAVE or RETURN statements to exit the loop

```
SET all_done = 0;
WHILE all_done = 0 DO
    call work_to_do( all_done, hit_error );
    IF hit_error = 1 THEN
        LEAVE;
END IF;
END WHILE;
```

The REPEAT UNTIL loop

- Loop until condition is true
- Test condition at end of loop
 - Like RPG DOU
 - Always iterate at least once
- Can also use LEAVE or RETURN statements to exit the loop

```
REPEAT
          CALL work_to_do( all_done, hit_error );
          IF hit_error = 1 THEN
                LEAVE;
          END IF;
UNTIL all_done=1
END REPEAT;
```

The FOR loop

```
create or replace procedure jvalance.sp Build JVCUST()
language sql
result sets 0
begin
   /* Populates table JVCUST with selected data from table SP CUST */
    declare wk full name char(20); -- to hold first + last
    delete from jvalance.JVCUST; -- clear previous data
    FOR custrow AS csr custs cursor for SELECT * from SP CUST
    DO
                                                      ' ' || trim(custrow.LASTNAME);
        set wk_full_name = trim(custrow.FIRSTNAME) ||
        insert into JVCUST (
            CUST ID, COMPANY, CUSTNAME, PHONE
        ) values (
            custrow.CUST_ID, custrow.COMPANY wk_full_name, custrow.PHONE
        );
    END FOR;
end;
```

Running procedure sp_Build_JVCUST

```
93 cl: addlible jvalance;

94

95 call jvalance.sp_Build_JVCUST();

96

97 select * from jvalance.jvcust;
```

** Can use library lists **	Cannot use library lists	

Library List Considerations

- To use library lists, connect to DB with "System Naming"
 - vs. "SQL Naming", which only allows one library (aka schema)
 - ▶ In CA/ACS: menu Connection... JDBC settings... Format tab
 - In JDBC-based connections, set property: naming = system
- Run "SET PATH *LIBL;" in ACS SQL client, before creating procedures
 - ▶ Path is stored in DB2 repository with the procedure object
- Do NOT hard-code library names in your stored procedure source code (use un-qualified object names)
- Connect to DB with a USRPRF that has the proper library list
 - via the USRPRF's JOBD libl
 - When compiling and running

Viewing SQL Stored Procedure objects
